

Individual Reflection Week 3

This week was a bit slower and different than usual because we started coding but since none of us really have much experience with agile we didn't really know how many people to assign on different user stories/tasks or how long they would take. What ended up happening was that 4 or 5 people got assigned to one user story and since the 2 other user stories were finished really quickly it meant that I was kind of left out while 5 people were doing something one person could do.

I still want to be able to use android studio better because this week i didn't use it very much which resulted in me falling behind a little bit. The goals still hold from last week

The IT students are helping the others with Github and setting it up but also explaining how to use it. This is a good step in cooperating together and we will continue to try to cooperate to the best of our abilities.

I have added and edited user stories, epics and tasks. We are continuously working and adding new things to our scrum board. The way we are working now seems to be effective and I will try to continue with this.

I have helped set up Github and start the project and this time the Github repo is more properly set up and is ready for next week's coding. I have also helped with the mockup and planning of the project. I would also like to code a bit more but that will come in the near future.
