

Individual Reflection Week 6

This week does not stand out in any particular way from the rest. We managed to again like last week split up the workload and evenly distribute the work that had to be done this week.

I have been steadily improving my skills with android studio and understanding how it works. I have not worked on implementing android architecture this week because it is too late into the project to change the structure of the code. Instead I will focus on code reviewing and maybe in my next project I can, from the beginning, implement an android architecture.

Github is still working well. We will resolve conflicts as a team and everyone still has a good understanding of how it works. I have taught and discussed what I know. Everyone is at the same level at the moment.

The scrum board is working well and is continuously being updated. This week we focused on 3 user stories and split up the work evenly. Again like last week we had a better understanding of the user stories which led to a better work environment. We did not get around to testing this week but will be sure to implement it in the future.

I have been coding the tasks and completing user stories. There was not much time put on testing or quality but that will be done in the next sprint. I did manage to get around to doing the design but did not finish, so I will also continue with that on the next sprint.
