Individual Reflection Week 2

This week was a lot of meetings and not much coding which is what should be occurring since we are still in the planning phase.

We have decided to use android Studio to develop our app. I have not used Android Studio before and lack knowledge of how to start a project but also all of the libraries and implementations.

I want to learn Android Studio to the level that I am confident in my knowledge and can code with my team with a nice flow. To get there i have to read and watch tutorials on Android studio but also start to use it and get familiar with it.

All of the group members have different backgrounds and know different things which is good but we need to cooperate in a way that plays to all of our strengths. I help to set up github but have yet to code anything. The next step would be to get familiar with Android Studio. To do this I have to focus on the dynamic programming structure and Android Studio to then work together and communicate about the coding

We still have not done anything on the scrum board but the goal from last week's Individual reflection still holds.

I have created a github but the repo lacks depth which will be implemented in the future. The goals of the code also still holds from last week where I focus on the code quality and a dynamic structure for maintainability. We still need to plan the code but also keep in regular contact with the product owner so the code doesn't need to be completely changed and the code base/frame stays the same
